PROFESSIONAL SUMMARY

I am accomplished **Senior Software Engineer** with **8+ years of experience** in building **scalable systems** across **Web3, e-commerce, and gaming domains**. I have led teams in developing **centralized, decentralized, and SaaS-based platforms**. Skilled in designing **resilient, observable systems** with tools like **Prometheus, Grafana**, and centralized logging. My ability to solving **complex engineering challenges** and improving **performance, reliability, and user adoption** at scale.

EXPERIENCE

Lead Senior Software Engineer

April 2021 - Present

Fynd/JioRelience | Projects - Fynd Engage, Frolic, KraftNFT, Product Recommendation

- Led architecture and development of a real-time fantasy platform (**Frolic**) using an **event-driven microservices** approach with **Node.js, Kafka, Redis, MongoDB, and PostgreSQL**. Scaled system to support **200K+ concurrent users** while automating core workflows such as **contest creation, auto-cancellation, and prize distribution**. Ensured system reliability and performance through strong **unit test coverage** and robust service orchestration.
- Expanded real-time Product Recommendations for the Search Extension, syncing over **100K+** products and **100K+** user events per hour to **Google Retail Cloud**, powering search and recommendation experiences for brands like **Tira, RelienceTrend, Netmeds, and GoFynd**.
- Planned and implemented a high-performance **WebSocket** microservice in **Node.js**, backed by **Redis, MongoDB, and Kafka**, enabling real-time matchmaking. Reduced latency from **2s to 500ms**, offloaded polling load from main servers, and boosted user satisfaction by **30%**, significantly increasing platform retention.
- Built a full-featured **crypto marketplace** using **Node.js, Redis, MongoDB, PostgreSQL, and Kafka**, enabling users to create/manage sell orders via an order book, mint **NFTs**, and run auctions across **Solana, Ethereum, and Tron** using **ERC-721 and ERC-1155** standards. Streamlined onboarding with an internal extension adopted by **Reliance** and **GoFynd** for e-commerce integrations. Achieved **\$11K+** monthly revenue with **45K+** daily active users, **92%** uptime, and API latency between **35-55ms**.
- Designed and implemented multi-chain custodial and non-custodial crypto wallet infrastructure supporting **7K+ transactions in Q1**, spanning **Ethereum, Solana, and Tron**. Authored detailed whitepaper and system architecture for a **custom coin** with cross-chain trade support via marketplace integrations.
- Enhanced a custom load testing platform using **k6 and xk6**, integrating TypeScript test scripts, ClickHouse reporting, and Grafana dashboards. Automated performance testing with configurable VU/iteration parameters, supporting CI workflows and detailed observability through Dockerized infrastructure.

Software Engineer

October 2018 - January 2021

Quillhash | Projects - QuillAudit | Centralex | Zeptagram

- Led the development of a scalable **crypto exchange platform** using **Node.js, MongoDB, Redis, Kafka, and K6** for load testing. Designed 150+ REST APIs supporting centralized wallet management across **Bitcoin, Ethereum, Solana**, and other major tokens. Implemented Kafka-based event-driven architecture for real-time wallet credit, debit, and order book settlement. Built efficient monitoring services and supported **8K+ concurrent trades**, successfully onboarding **72K+ global users**.
- Built a generic product tracking system on the **Ethereum blockchain**, enabling dynamic smart contracts with customizable attributes for real-time shipment and ownership tracking. Integrated with **DMCC**, supporting **200K+** shipments and **50K+** smart contracts across **12+** product categories.
- Engineered a **Smart Contract Audit and Decentralized Wallet Management** extension using **Node.js, PostgreSQL, Memcached, and Kafka**, deployed across **Ethereum, Polygon, and BSC** networks. Led a team of **4+ developers**, driving architecture, security reviews, and blockchain integrations. The solution managed **10K+ active wallets** with real-time access control and audit trails, generating over **\$16K** in monthly revenue.
- Built **Zeptogram**, a decentralized music rights platform using **Node.js, React.js, and MongoDB**, enabling creators to independently **upload, sell, and retain ownership** of audio assets without intermediaries. Engineered backend microservices in a fully **event-driven, distributed architecture**. Improved a custom **Ethereum-based crypto coin** and supported **NFT (ERC-721)** transactions across all audio formats, with comprehensive tracking of user activity and transaction history. Successfully onboarded **90K+ users**.

Software Developer

April 2016 – September 2018

Darwin Labs | Projects - MurMur | GainBitcoin | Sportsy

- Built an Android application using **Java** and **XML** in **Android Studio**, integrated with a high-performance backend to support **80K+ active users** in real-time **cricket betting** on the **Sportsy** platform.
- Played IC for **Murmur Android application**, a news aggregator that delivered **short-form news across multiple categories**, predating platforms like Inshorts. The app attracted attention from **Hindustan Times**, which extended an **incubation offer** for further development.
- Developed an Android application with a secure **Bitcoin wallet system** using **Android Studio** and **Node.js**.
- Managed company-wide **New Relic** monitoring, diagnosed performance bottlenecks, and optimized slow queries, reducing average response time by **40%** across core services.
- Built a React-based dashboard integrated with **Ethereum smart contracts** to enable **decentralized audience segmentation** and real-time monitoring based on **age group**, **gender**, and **location** preferences, similar to Facebook Audience tools but in a **Web3-native** architecture.
- Built and launched a **promotions and discount system** from scratch using **Node.js**, **MongoDB**, **Redis**, **Kafka**, and **Webhooks**, enabling dynamic campaign rules and real-time application. Increased **average order value** by **20%** and contributed to significant **revenue growth**.

EDUCATION

Jaipur National University

Bachelor of Technology

Jaipur-Rajasthan

July 2012 - October 2016

Shri Rama Bharti Public School

Physics, Chemistry, Math

NCR-New Delhi

July 2010 - October 2012

AWARDS & ACHIEVEMENTS

- Recognized with the **Employee of the Year** and **Star Performer Award** at **Reliance Jio (Fynd)** for outstanding contributions to backend architecture and delivery of mission-critical systems.
- Awarded **Best Team Lead – Growth Category** for driving measurable team outcomes and leading high-performance squads across decentralized and SaaS projects.
- Optimized infrastructure by reducing **API latency**, enhancing **database query speed**, and increasing **system throughput**, contributing to significant performance improvements in production.
- Certified as an **Ethereum Smart Contract Developer** by **IBM**, demonstrating advanced understanding of Solidity, smart contract security, and decentralized application design.
- Earned certifications in **Android Development** and **Node.js**, showcasing hands-on expertise in building mobile-first and scalable backend solutions.
- Secured **Runner-up position** in the **CrossFit Challenge** hosted by **Reebok**, exemplifying personal discipline and high-impact leadership beyond the engineering sphere.
- Contribute to the tech community via **technical blogging** on platforms like Medium — covering Web3, backend design, and debugging topics: **@sahityakumarsuman**.

TECHNICAL SKILLS

Languages: JavaScript, TypeScript, Java, C, Python, SQL

Technologies/Frameworks: Nodejs, NextJS, VueJs, Express, Redis, Memcached, Kafka, BullMQ, WebSocket, MongoDB, Postgres, Git, REST API, AWS, GCP, Azure, Docker, Kubernetes, Firebase, K6

Developer Tools: VS Code, Webstorm, Jira, NewRelic, Sentry, Coralogix, Helm, Google Ads, Google Analytics
